Chapter 1 Getting Started

The first thing to learn about your computer is the different configurations that made up a complete system. This chapter is all about these configurations and a brief description on their functions.

ъ

Every complete computer system consists of:

1.1 The System Unit

The system unit is the personal computer itself and it comes in the form of an attractively designed box measuring about $400 \times 120 \times 380$ mm. Housed inside are the different vital parts that make the system unit function. These include the Central Processing Unit (CPU) which is also referred to as the heart of the computer, the power supply, fan, motherboard, peripheral interfaces and circuitries, etc.

1.2 The Real Panel

Important features on the rear panel like the power switch, sockets and connectors provide convenience for connecting peripherals like the keyboard, printer and monitor to the system unit.

Fig. 1-1 The Rear Panel

Provided with the system is a 84-key typewriter style keyboard. The keys are low profile, full travel, sculptured type. In additional to the standard typewriter keys, there are the function keys, cursor control keys and numeric keypad for user convenience.

The keyboard can also be inclined for typing comfort. To tilt the keyboard, pull out the two pivotal legs at the bottom. Refer to Chapter Four for details on keyboard usage.

Fig. 1-2 Keyboard

The Rear Panel Connectors and 1.4 Switches

The power switch, peripheral sockets and connectors are located at the rear panel of the system unit as shown in Fig. 1-3. The corresponding peripherals that can be attached are also shown.

Fig. 1-3 The Rear Panel

Power is supplied to the system unit by means of a power cable. The three-prong male socket from the cable should be plugged to the system power socket in the rear panel as shown in Fig. 1-4. The other end of the cable is plugged to the power source.

Fig. 1-4 System Power Socket

The power switch is located at the upper left corner of the rear panel. The power to the system is turned on and off using this switch.

Fig. 1-5 System Unit Power Switch

For monochrome monitors, the monitor power cable should be connected to the video monitor power socket located below the system power switch. Color monitors are usually plugged directly to the power outlet.

Fig. 1-6 Video Monitor Power Socket

The keyboard connector (Fig. 1-7) provides the interface between the system unit and the keyboard.

Fig. 1-7 The Keyboard Connector

Inside the system unit is a vertical motherboard that supports four horizontal expansion slots. Add-on cards are inserted horizontally into these slots as against the conventional vertical insertion.

The CPU card is inserted in the lowest slot while the IO board occupies the next-to-lowest slot.

A display card may or may not be added into one of the two upper slots depending on your model. For details on how to install a card into the slot, refer to Chapter 4.

Fig. 1-8 The MotherBoard and the Expansion Slots

1.10 The CPU Card

On the CPU card are:

- A. The 8088 CPU working at 4.77 MHz without coprocessor 8087.
- B. ROM: 8K bytes for BIOS (U36)
- C. RAM: up to 512K bytes of memory can be installed on board without parity check.
- D. DMA (8237): working at 4.77 MHz
- E. WAIT: I/O RW Wait 1 clock for 4.77 MHz
- F. Keyboard Interface: Compatible with IBM-PC keyboard.
- * The total memory can be expanded to 640KB (512KB on board and 128KB on the expansion card) by using an expansion card - the MEB-500. For details on how to use the MEB-500, please refer to Appendix I.

Fig. 1-9 CPU Card Block Diagram

1-11

Chapter 2 Keyboard Usage

The keyboard serves one of the most important functions in a computer system. Without the device, direct communications between the computer and the user will be impossible.

By using the keyboard, the user can key in commands directly and store them in the diskette, or simply "echo" data entered on the screen.

There are 84 keys on the keyboard. These keys are divided into three groups: 1) the main keyboard, 2) the numeric key pad, and 3) the function keys.

Multitech Image: String Str

2.1 The Main Keyboard

Fig. 2-1 The Main Keyboard

The main keyboard is similar to an ordinary typewriter keyboard. It is used mainly to enter alphabets from A to Z, numeric digits from \emptyset to 9, special signs, and punctuation marks such as:

! @ # \$ % ^ & * () _ - + = [] { } : ; ' " ~ ` _ - + = | \ < > , . ? / Once a key is pressed, its corresponding character will be displayed on your video monitor. In this case, we say the pressed key is "echoed" on the screen in computer terminology.

2.1.1 The Shift Key

Fig. 2-2 The Shift Key

The main keyboard may be used to enter both upper and lower case characters. On an ordinary typewriter keyboard, pressing the Shift key and any key will produce an upper case character of that key. By the same token, to type an upper case character using this keyboard, press the desired key while holding down the Shift key. The Shift key is always used together with another key.

2.1.2 The Ctrl (Control) Key

Fig. 2-3 The Ctrl Key

The control key, which is marked "Ctrl", is another kind of shift key. Normally, it is used together with other keys to generate an internal code for a special function that the system understands. 2.1.3 The Alt (Alternate) Key

Fig. 2-4 The Alt Key

The Alt key is a third kind of shift key that is used in conjunction with other keys to perform a special function.

2.1.4 The Caps Lock Key

Fig. 2-5 The Caps Lock Key

This key is located on the lower right corner of the main keyboard. This key functions as an on/off (toggle) switch for shifting from capital letters to small letters.

Pressing this key once will lock your keyboard to the capital-letter-only mode. After locking the keyboard to the capital-letter-only mode, all the keys pressed will be echoed in upper case letters on the video monitor. Pressing it again will return your keyboard to the lower case mode.

Fig. 2-6 The Enter Key

This is the Enter key. It is equivalent to the typewriter's carriage return. When the Enter key is pressed, the cursor will move to the beginning of the next line.

2.1.6 The Backspace Key

,

```
Fig. 2-7 The Backspace Key
```

Pressing the Backspace key will move the cursor one character to the left of its current position, at the same time deleting the character from the position it has moved from.

2.1.7 The Tab Key

Fig. 2-8 The Tab Key

The Tab key shifts the cursor eight spaces to the right at each press. However, it cannot cause the cursor to tab to the left.

2.1.8 The Space Bar

Fig. 2-9 The space Bar

The Space bar is located at the bottom of the main keyboard. This key is used for producing spaces.

Fig. 2-10 The Numeric Keypad

On the right side of the keyboard is the numeric keypad as shown by the shaded keys in Fig. 2-10. These keys have two specific functions, including the numeric or cursor-control modes.

When serving as the numeric mode, the keys in this area are used for entering numerals. This is rather convenient for entering long string of numeric data.

The default is cursor-control mode. This means that upon power on, the keys on the numeric keypad will be used to shift the cursor one space to any of the four directions as indicated by the respective keys."

To enter the numeric mode, press the Num Lock key once. Pressing the "Num Lock" key for a second time disables the numeric mode.

The usage of each key in the numeric keypad depends on different software. A detailed explanation of the operation of some special keys in this area are as follows:

Pressing this key once will print an asterisk (*) on the screen. When this key is used together with the "Shift" key, all the data on the screen wil be printed on the printer. When used with the "Ctrl" key, each line of data will be printed as they are entered from the keyboard.

This key is defined differently by different application softwares. Please refer to the manual pertaining to operating system or application programs for the key's usage.

This key is used to determine the movements of the text on the screen when the cursor reaches the top line of the screen or the bottom of the screen. Pressing it once will cause the LED labelled "Scroll Lock" to light up. Pressing it again will turn off the LED.

When this key is locked on, the cursor-up and the cursor-down keys move the text on the screen up or down one line without changing the cursor position.

There is also another function for this key. The "Break" key is used together with the "Ctrl" key to terminate the execution of a program or command.

This key is a function key whose usage depends on your own application programs or operating system.

This key is used to insert character(s) in a line. When a character is inserted, all the data to the right of the cursor moves one position to the right. Under certain application software, pressing this key once will cause the screen to stay in the "Insert On" mode.

This key is used to erase the character where the cursor is positioned. When a character is deleted from a line, all the data to the right of the cursor moves one position to the left.

This key is used to enter the minus symbol.

This key is used to enter the plus symbol.

Cursor Control Keys in the Numeric Keypad

This key is called the "cursor-up" key whose function is to move the cursor up one line at a time.

This key is called the "Cursor-down" key whose function is to move the cursor down one line at a time.

This key is called the "cursor-right" key which moves the cursor one position to the right at a time.

This is the "cursor-left" key which moves the cursor one position to the left at a time.

This key is called the "Home" key which moves the cursor to the top left corner of your screen.

This is the "End" key whose function depends on the definition of different application software.

This key is called the "Page-Up" key which moves the cursor up by one screen. The length of one screen depends on the definition of different application software.

This key is called the "Page-Down" key which moves the cursor down by one screen. The length of one screen depends on the definition of different application software.

2.3 The Function Keys Under the MS-DOS

Fig. 2-11 The Function Keys

Under MS-DOS, the first five function keys are used mainly for editing. Their functions are:

2.3.1 Fl

Fl is used for displaying one character from the template each time you enter this key. The same results can be achieved by using the right direction arrow key ("6" on the numeric keypad).

For example, type "Personal Computer" from the keyboard and hit F5 to enter the characters into the template. Press the F1 key 17 times and all the characters, one character at a time from left to right, will be displayed.

2.3.2 F2

Pressing F2 and a character will display all the characters preceding that character from the template. The specified character and the succeeding characters will not be displayed.

For example, pressing F2 and then "C" will immediately display "Personal" on the screen.

2.3.3 F3

Pressing F3 will copy all the characters from the template to the screen.

2.3.4 F4

This key will delete all the characters preceding a specified character.

Let's continue with the above example. Enter "Personal Computer" and press F5. Press F4 and "C". Nothing seems to have happened. Don't worry. Now press F3 and "Computer" will be shown on the screen. The characters preceeding the "C" in "Computer" has been deleted.

2.3.5 F5

Pressing F5 will send all the keyed in characters to the template without sending them to the computer for processing.

For example, after the MS-DOS prompt > appears, enter "Multitech Personal Computer" and press F5, a "@" will be displayed at the end of the line and the cursor will move to the beginning of the next line. Now enter the key F3, all the characters that you just typed into the template will be displayed.

2.4 Other Editing Keys

Aside from the five function keys, there are three more keys that are used for MS-DOS editing. They are the "Del", "Ins" and "Esc" keys on the numeric keypad.

2.4.1 Ins

Ins will insert characters anywhere in the line. The "Ins" key is located at the bottom of the numeric keypad.

For example, key in "Personal Computer". Press F5 to enter these characters into the template. Press F1 until "Personal" is displayed on the screen. Press "Ins" key once and key in "micro". Now press the "Ins" key again to exit from the insert mode. Press F3 and "Personal microcomputer" will be shown on the screen.

2.4.2 Del

The Del key deletes characters (to the right of the cursor position) from the template without moving the cursor position on the screen. It is located at the bottom of the numeric keypad.

Using the above example, press Fl until "Personal" appears on the screen. Press the Del key five times (to delete "micro") before pressing F3. Now "Personal computer" will be shown on the screen.

2.4.3 Esc

The Esc key will cancel the current line on the screen. However, the characters in the template remain unchanged. While "Personal computer" is being displayed, press the "Esc" key. The cursor will move to the next line. You can either enter new data and press the Return key to remove the previous data from the template, or you can press F3 to re-display "Personal computer".

Chapter 3 On-board Switch Setting
There is a DIP (Dual In-Line Package) switch on the CPU card designated as SW1. On this switch are eight slide switches that can be set to "ON" or "OFF" by using a pin or toothpick.

The switch is adjusted so that the microprocessor can access the devices connected directly or indirectly to it, e.g., the RAM (Random Access Memory) and peripheral devices that are connected to or installed in your system unit.

3.2 The Location of the DIP Switch

The switch is positioned conveniently in the rear panel in such a way that it can be accessed without having to remove the housing from the system unit.

Remove the metal strip on the CPU Board by loosening the screw as shown in Fig. 3-1. The DIP switch is then visible.

The locations of the two switches are shown in the following illustration:

Fig. 3-1 Location of the DIP Switch

To operate your system properly, SWl should be set properly. The following is a summary of the function of each slide switch. The summary provides you with an overview of the functions of the two configuration switches.

3.3 Descriptions of the Big Switches

3.3.1 SW1 - DIP Switch One

Switch No. Function ----SW1-1 Enables disk drive. SW1-2 Unused SW1-3 SW1-3 and SW1-4 determine the amount SW1-4 of RAM installed on the system board. SW1-5 Determines the number of display columns. SW1~6 Determines display type. SW1-7 SW1-7 and SW1-8 determine the number SW1-8 of disk drive(s) installed in the system unit.

3.4 Default Switch Settings

3.4.1 SW1 - DIP Switch One

Switch No.	Default Setting	
*****	*****	
SW1-1	OFF	Disk drive enabled.
SW1-2	*	Unused
SW1-3	OFF	Default Memory Size is 256K
SW1-4	OFF	

SW1 ~ 5	ON	Default display type is CGA and display is 80 characters by 25 lines.
SW1 ~ 6	OFF	•
SW1 - 7 SW1 - 8	ON ON	Default number of drives is l

3.5 How to Set the Switches

We strongly recommend that all switch positions be noted down before attempting to adjust any of the switches (so that you can reset them to their original positions if necessary).

- 3.5.1 Switch No. 1 SW1
- SW1-1 The normal position of this slide switch is OFF. This will load the operating system from the floppy disk drive to the system memory upon system power on. If it is ON, the diskette drive(s) will be deactivated, and the system cannot be booted even if you have diskette drive(s) installed and operating system program inserted in your diskette drive.
- SW1-5 The video display type is determined by SW1-5 and SW1-6. Be forewarned that setting the slide switches for the display monitor differently from those given in this manual may damage your display. For monochrome display monitor, this slide switch should be set to OFF. For color display monitor having 40 characters per line, it should also be set to OFF. Refer to the following figures for the correct switch settings. Set this switch to ON if the Enhanced Graphics Adapter is installed.

SW1-6 This slide switch should be set to OFF for monochrome display. For color monitor with 40 characters mode, it should be ON. Refer to the following figures for the correct switch settings. Set this switch to ON if the Enhanced Graphics Adapter is installed.

Fig. 3-4 Switch Setting for Color Card 80 x 25

- SW1-7 The number of disk drives is determined by switches SW1-7 and SW1-8.
- SW1-8 In combination with SW1-7 the purpose of this slide switch is to determine the number of diskette drives in the system unit.

# Chapter 4 How to Install the Expansion Board

To install an expansion board into the system, simply follow the following steps:

- 1) Turn off the power switch on the rear panel of the system unit.
- Turn off all external power switches (such as Monitor, Printer, etc.).
- Disconnect all cables from the rear panel of the system unit, remembering distinctly where each cable was attached.
- 4) Place the system unit in a convenient position to allow easy access to the rear panel.
- 5) Remove the three screws from the cover with a flat screwdriver by turning them counter-clockwise as shown below. (Save the screws for re-installation of the cover.)

Fig. 4-1 Removing the Screws

6) Carefully slide the system unit's cover a few inches toward the rear as shown below, then pull both sides a little bit sideways.

Fig. 4-2 Openning the Top Cover

7) Raise the cover upwards and pull backwards. Set the cover aside.

Fig. 4-3 Removing the Cover

- There are four expansion slots on the mother board. You can insert the expansion board in the unused slot.
- 9) Remove the metal strip that corresponds to the expansion slot by turning the screw counter-clockwise (save the screw for the re-installation of the expansion board).

Fig. 4-4 Removing the Metal Strip

10) Remove the screw on the board stopper and pull forward until it becomes horizontal. Insert the board horizontally. Make sure the board slides into the plastic groove on the right side.

## Chapter 5 How to Install the Floppy Disk Drive on the System Unit

There is only one built-in floppy disk drive in our system but two floppy disk interfaces are supported by the FDI on the I/O board. For users who wish to expand their system by adding another disk drive, just follow these steps:

- 1. Place the system unit on a work table. Remove the housing from the system unit by removing the three screws from the rear panel.
- 2. The disk drives are housed inside the floppy drive unit inside the system unit. The built-in disk drive occupies the upper bunk; while the lower bunk is reserved for a second drive.
- 3. Remove the four screws from the floppy drive unit, refer to Fig. 5-1. Save the screws for reinstallation.

Fig. 5-1 Removing the Screws from the Floppy Drive Unit

4. Slide the floppy drive unit towards the rear of the system unit until the lever of the built-in floppy disk drive is beyond the top of the front panel. Remove the floppy drive unit by lifting it upwards, then place it on the work table. See Fig. 5-2.

Fig. 5-2 Removing the Floppy Drive Unit

5. A plastic board covers the empty lower bunk to prevent dust and other foreign materials from getting inside the system unit. Remove the plastic board by removing the two screws that attach it to the floppy drive unit as shown in Fig. 5-3.

Fig. 5-3 Removing the plastic board from the Empty Lower Bunk

Fig. 4-5 Inserting the Card

- 11) Note that the board should be inserted between two notches in the board guide. Screw the board in place. Return the card stopper to its original position and screw it in place.
- 12) Read the instructions for the option card and make the necessary connections if any.
- 13) Replace the cover and reinstall the screws.

# Appendix

.

A-I

The keyboard is connected to the system through a cable attached with a 5-pin DIN connector. The following table lists the pin assignment of the connector and their corresponding signals.

Pin No.	Signal
1	Clock
2	Data
3	Reserved
4	Ground
5	+5 Vdc

#### Note:

When you power on the system unit, the firmware will perform a series of self-tests. The results of these tests are displayed on the screen. Note that the video display will remain blank for a few seconds after power up.

After powering on your system unit, you will hear a long beep generated by the built-in speaker unless an error occurs.

The possible errors are:

1. System halt!

DMA Register R/W error.

- 2. The system halts after generating a long beep, when an R/W or parity error has occurred in the memory range from Ø through ØFFFFH on the system board.
- 3. The system generates two short beeps after a long beep. This error occurs when R/W error is detected on the color/graphic adapter.

The first screen shows the results of the self-test:

*** SELF-TEST ***

RAM TEST (Y/N) ? X

.RAM SIZE (K) XXXX

NOTES:

- A. The DIP switches on the system board are set for actual RAM size. If you have inserted additional RAMs on the system board, the DIP switches will have to be adjusted accordingly, else the screen message will not echo the correct RAM size.
- B. The top three rows of the self-test messages are used to show whether the color signals are transferred normally between the sytem unit and the video display.

If you use a monochrome video display connected to the system via a Monochrome Display and printer Adapter, the top three rows of the self-test will not be shown.

But if you use a color monitor, the "R" line is red, the "G" line green and the "B" line blue.

4. .8259 Error!

This means 8259A PIC error.

5. .8253 Error!

Represents 8253 Timer error.

6. PR.P.Err

Printer Port Error.

7. K B Error!

Keyboard not connected or out of order.

8. .BAD FDC!

Disk controller error.

9. Warning RAM Error!

Indicates that there is an error in one of the memory banks, the location of which is currently shown on the screen.

After the Self-test, the operating system will be booted into the system. At this point, if a non-system diskette is inserted in the default drive, the screen will display the following error message:

> Non-System disk or disk error Replace and strike any key when ready

Or, if no system diskette is inserted in the default drive, this error message will be displayed:

*No-system * *Insert system disk and strike any key when ready A 32K ROM space (F6000  $\sim$  FDFFF) is available at U43 and if you insert a 27256 chip in that location, the memory space should be mapped as follows:

#### 27256 Chip

Memory Address

lst 8K bytes	F8000 $\sim$ F9FFF
2nd 8K bytes	FAØØØ $\sim$ FBFFF
3rd 8K bytes	FC000 $\sim$ FDFFF
4th 8K bytes	F6000 $\sim$ F7FFF

For your convenience, below is a cross reference:

,

ι

The memory expansion board MEB-500 is a small printed circuit borad on which 128KB of RAM is installed. This expansion board could be installed to the CPU card to expand the system RAM of the Popular 500 from 512KB to 640KB.

NOTE: If your CPU board is not installed with 512KB, you should first expand its memory to 512KB before installing the MEB-500.

The MEB-500 card is shipped to you with two copper bolts and four screws, which are used for attaching the MEB-500 to the CPU card.

On the component side of the MEB-500, you can see three locations markded with Ul2, U21, and U29. There are three connectors with round pins soldered to the three locations and with the round pins extending on the other side of the MEB-500.

After unpacking, you should check whether the round pins on the three connectors are straight. If they are bent, straighten them. Then, fasten the two copper bolts to the CPU card as illustrated below:

To install the MEB-500 to the CPU card, you must insert the round pins to three sockets on the CPU card. The three sockets are also marked with the same numbers -U12, U21 and U29.

While inserting the round pins to their sockets on the CPU card, be cautious that each pin is aligned properly so that they will fit into the right holes on the sockets. Don't exert excessive force while making the connection. If a pin bends twice or three times, it may be broken.

Since some of the CPU card is built with ICs inserted on the locations Ul2, U21 and U29. You must first extract the ICs on the two locations and then solder the round-pin sockets to these locations. Then, you can attach the MEB-500 to the CPU card following the steps mentioned above.

After installing the MEB-500 to the CPU card, you must fasten the remaining two screws to the copper bolts.

If you want to change the system back to 512KB model, make sure U12 is installed with 41256, U21, 74LS245; and U29, 20L10.
